**SOUND WAVE IN A GIVEN SPACE**

When a sound wave is emitted from its source, it propels in all directions. The sound carries in a space unless it comes across an obstruction or an absorbing element such as carpeting, or upholstery. Harder materials will enable sound waves to reverberate in the space for a longer period of time. A sound can be direct like a face to face conversation and it can be reflected back from a hard surface.

**REVERBERATION**

The persistence of sound after it has been stopped due to multiple reflections from surfaces within a closed space

**T60 : REVERBERATION TIME**

The time it takes for a sound to decay by 60 dB once the source of sound has stopped. Reverberation time is the basic acoustical property of a room which depends only on its dimensions and the absorptive properties of its surfaces and contents. An acceptable value for class rooms and libraries ranges between 0.5-0.9 seconds. A suitable value for open offices and conference rooms ranges between 0.7 and 1.25 seconds

**NRC - NOISE ABSORPTION COEFFICIENT**

The Noise Reduction Coefficient is a scalar representation of the amount of sound energy absorbed upon striking a particular surface. an NRC of 0 indicates perfect reflection. an NRC of 1 indicates perfect absorption. Higher number equals better performance.

**SABIN**

A unit of sound absorption based on one square foot of material. Products with higher Sabin values provide more sound absorption.

**SABIN COUNT**

The sum total of the absorption coefficients in a room. Stronger NRC values will deliver higher Sabin counts.
